13ED08 – Plant density in low rainfall canola				
Authors	Mark Seymour			
Location of trial Geoff Sanderson's, Bishops Road Grass Patch				

## Summary (Key messages)

- Birds preferentially attacked low density treatments and late maturing variety Hyola 450TT.
- The results from this site should be treated with caution

## **Background**

Canola is now being grown in low rainfall areas. Primarily farmers choose open pollinated TT varieties. However breeding companies are favouring the development of hybrids in order to pay for breeding services. Hybrids provide growers with more vigorous seedlings, comparatively better plant establishment and generally higher yields. However growers have to purchase new seed of hybrid varieties every year in order to get these potential yield benefits. Seed for hybrid canola is 25 times more expensive than the seed of open pollinated canola. Inevitably if farmers are forced into hybrids they will wish to minimise seed costs by sowing at low densities.

#### Aim

To investigate the plant density response to yield and oil content of TT and RR hybrid canola in comparison with open-pollinated canola

#### **Trial Details**

- Property: Geoff Sanderson's, Bishops Road Grass Patch
- Agzone 5, Growing Season rainfall (GSR) = 224 mm, GSR + stored water (estimate) = 320 mm
- Soil type: Loam (0.97% organic carbon)
- Paddock rotation Barley 2012 1.7 t/ha, 2011 Wheat 2.26 t/ha, 2010 Canola 0.87 t/ha, 2009 Wheat 1.86 t/ha
- Fertiliser (kg/ha) 99 kg/ha of Allstar at seeding (13.1%N, 14.8%P, 15%S, 0.1% Cu, 0.2% Zn, 7ppm Mo, 0.02% Mn), 120 kg/ha of Muriate of Potash and 400 kg/ha of gypsum (17% Ca, 14% S) topdressed over whole site 4 weeks after seeding, 145 L/ha of UAN (32%N) June 3.

#### Treatment detail

• 36 treatments:

- 2 HT Herbicide tolerant canola (TT and RR)
- o 4 Cultivar
- o TT- OP = CB Telfer TT and Hybrid = Hyola 450TT
- o RR OP = GT Viper, Hybrid = Hyola 404 RR
- 8 densities of 5, 10, 15, 20, 30, 40, 60, or 80 plants/m²
- o 3 replicates

## **Assumptions used in Gross Margins**

Oil bonus +/- 1.5% per unit of oil (%) either side of 42%, with no oil ceiling.

Additional costs such as seeding, harvest, insecticides assumed to be \$100/ha.

Nitrogen costs \$1/kg, application costs \$8/ha

RR costs – seed \$31/kg, Herbicides \$28/ha, Grain worth \$482/t (CBH Pool Esperance 5/11/13).

TT costs – seed \$2/kg, Herbicides \$47/ha, Grain worth \$502/t (CBH Pool Esperance 5/11/13).

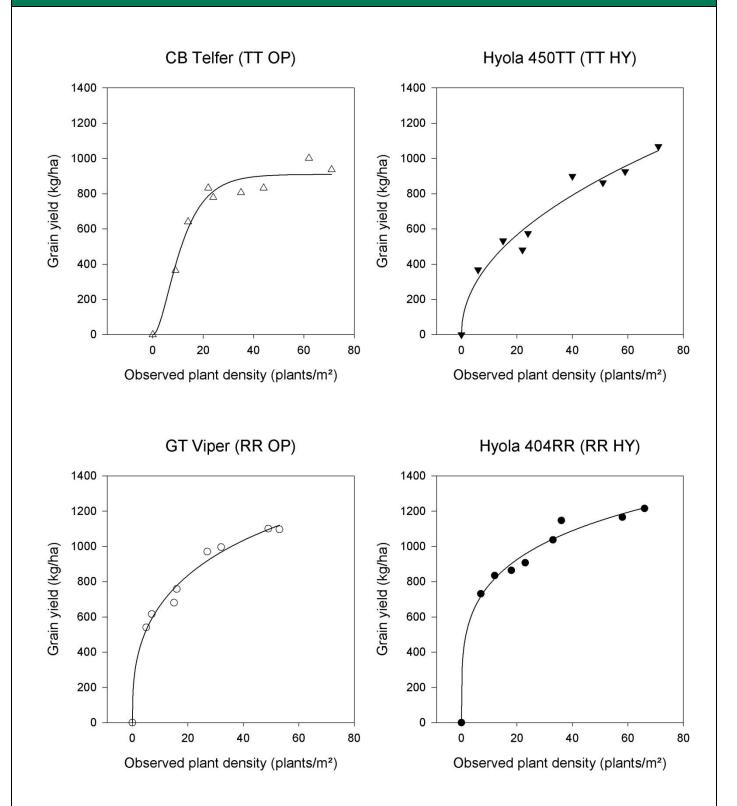

Figure 1 Relationship between plant density (observed, plants/m²) and the grain yield of (a) CB Telfer, (b) Hyola 450TT, (c) GT Viper and (d) Hyola 404RR at Sanderson's, Grass Patch in 2013 (13ED08)

At Grass Patch in 2013 the density trial suffered from attack by birds. The birds preferentially attacked the low density plots and the slightly later flowering/maturing hybrid TT variety Hyola 450TT. Therefore the yields of the low density plots were lower than expected and the economic optimums were higher than expected. However, the results from this site should be treated with caution and data from the Grass

Patch site have not been included in calculating average economic densities summaries across WA.

Table 1: Summary of economic optimum density (plants/m²) of canola from 11 experiments conducted throughout WA in 2013.

Location	CB Telfer or ATR Stingray	Hyola 450TT	GT Viper	Hyola 404RR	Comments
Cunderdin	25	22	28	17	
Eradu	34	33	24	16	
Grass Patch#	53	71	53	41	Low density treatments targeted by birds
Holt Rock	39	20	30	38	
Katanning	39	24	39	21	TT blocks weedier – more ryegrass in low density
Merredin	22	20	17	18	TT blocks weedier, more ryegrass in low density
Miling	36	27	20	12	Low establishment, low density = more ryegrass
Mullewa	19	12	10	14	Extended dry period and aphids
Pingrup	29	23	19	18	
Salmon Gums	31	25	22	18	Late emerging barley grass understory in RR blocks
Wongan Hills	40	35	34	21	TT blocks weedier, more ryegrass in low density

<sup>#</sup> Low density treatments at Grass Patch were preferentially attacked by birds; therefore this site was excluded from META analysis

#### Conclusion

For the trial series and not this site

The economic optimum plant density of canola appears to be different for each type of canola and in some instances may need to be altered for rainfall zones. Open pollinated TT canola which dominates the WA industry had higher optimum densities primarily because of the low cost of increasing density.

Optimum target densities and suggested seeding rates based on 2013 experiments are:

*OP TT* - 31 plants/m² which equates to a seeding rate of 2.1 kg/ha for ATR Stingray and 2.4 kg/ha for CB Telfer - but there is no economic reason not to go higher with farmer retained seed.

Hybrid TT - 23 plants/m² (seed rate of ~ 1.4 kg/ha). Using such a low seed rate may be risk so it may pay to increase seed rate if conditions are questionable or machine is not calibrated for low seeding rates

OP RR – 24 plants/m<sup>2</sup> (seed rate of 2.2 kg/ha)

*Hybrid RR* - 20 plants/m<sup>2</sup> equivalent to a seed rate of ~ 2.1 kg/ha. Adjust seed rate for variety/seed lot seed size differences

Note that all optimum densities calculated here assume a given field establishment of 50% for OP's and 65% for hybrids and 90% germination test. As observed field establishment rates can vary due to soil moisture, temperature and seeding errors. Similarly seed size may vary from those used in our trials. Farmer retained seed of TT OP's in dry areas is often smaller than purchased seed and it is our experience that hybrid seed size varies markedly from year to year. Therefore seed rates should be adjusted to suit individual circumstances. Variations in grain prices, seed size, germination and field establishment may also affect our optimum density calculations, particularly if the calculated optima are

not on the plateau of the response curve. In most instances for OP TT's and RR hybrids the calculated optima are on the plateau of the response curve and variations in assumptions and changing crop density will affect gross margins slightly. However for TT hybrids and RR OP's the crop gross margins may be more sensitive to variations in density.

## **Acknowledgements**

This trial is one of a series conducted throughout WA as part of the GRDC/DAFWA co-funded project "Tactical Break Crop Agronomy in Western Australia". Thanks to the Osborne family for hosting the trial and to the Esperance RSU for trial management. Pam Burgess (DAFWA. Esperance) provided technical assistance to ensure all treatments and measurements occurred in a timely and accurate fashion.
